SEEP/W supports a range of boundary condition options. Field data or user-specified functional relationships can be inputted to define hydrographs, reservoir fluctuations, rainfall cycles, vegetation effects, or land-climate interactions.

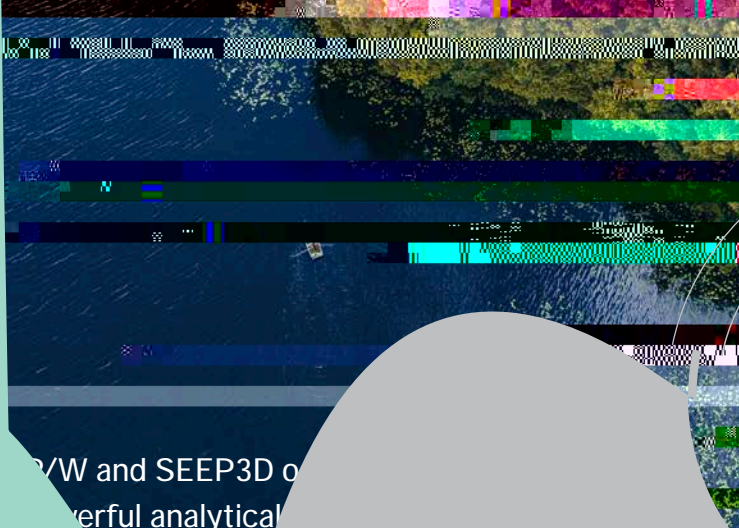

Integration of SEEP/W and SEEP3D with SLOPE/W makes it possible to analyze the stability of any natural or man-made system subject to transient changes in pore-water pressure. Seamlessly combine SEEP/W and SEEP3D, to analyze 2D and 3D groundwater flow in the same project file.

P

Hydraulic conductivity and volumetric water content functions can be estimated using built-in functions. The estimation process requires only fundamental information. A saturated-only material model is also available.

The rigorous saturated/unsaturated formulation of SEEP/W means that even the most demanding flow problems, such as infiltration into dry soil or seepage through complex upstream tailings dams, can be analyzed with ease.
